Design Basics - javascript

- Aditya Kumar
   Chief Technology Officer, edwisor.com

We will cover with the following concepts

1) Script tag

2) External JS file

Script tag is used to define a client side script

1) You should place the script tags at the end of body tag - for optimization reasons.

2) It's either used to encapsulate some behind the scene logic or mostly to manipulate the elements in the page.

3) You can write various javascript functions and declarations in a single file and systematically use them in various html pages of your website

4) Let's see script tag declaring javascript in action

You can place your javascript in a separate file

1)   Let's see an example of creating javascript in a separate file and including it in our webpage.

Next Steps -

1) What is responsive design

2) What elements have to be made responsive

3) Design principle Two.
